PROFESSIONAL SUMMARY

Web Application & API Penetration Tester with a Bachelor's degree in Digital Forensics and Cybersecurity. Hands-on experience identifying and validating security vulnerabilities including BOLA, BFLA, IDOR, authentication flaws, business logic issues, and Cross-Site Scripting (XSS) through manual web application and API security assessments. Proficient in Burp Suite, Python automation, API security testing, and authorized load and stress testing using Locust. Recognized by National CERT Pakistan for responsibly reporting a high-severity security vulnerability.

EXPERIENCE

• AI Pinnacle

Penetration Tester

03/2026 – Present

- Identified and validated BOLA, IDOR, BFLA, and business logic vulnerabilities by evaluating access controls, manipulating request parameters, and verifying authorization between different user accounts.
- Tested login workflows, verification code validation, and session management across multiple user roles to uncover access control weaknesses.
- Performed manual HTTP request manipulation and input validation testing, including reflected XSS analysis, while conducting directory/endpoint enumeration and frontend reconnaissance to expand the attack surface.
- Used Locust to simulate concurrent users for load and stress testing, and documented findings in technical reports with proof-of-concepts and remediation guidance.

• SM Digital

Cybersecurity Curriculum Designer Intern

02/2026 – 03/2026

- Designed a structured 90-day cybersecurity curriculum covering networking fundamentals, Linux, Ethical Hacking, Web Application Penetration Testing, and related security concepts from beginner to advanced levels.
- Organized course topics into a progressive learning roadmap, ensuring a logical sequence of concepts and practical skills for student training

• National CERT Pakistan

Penetration Tester – CyberNest Program

11/2025 – 01/2026

- Identified a Broken Function Level Authorization flaw allowing unauthenticated complaint submission via an exposed admin dashboard and backend API.
- Identified insecure client-side authentication design, flat-file data storage, and a misconfigured endpoint exposing mail server information.
- Identified and exploited hardcoded API/auth tokens, IDOR, and broken access control across production environments, plus insecure input validation in the forgot-password feature and verbose error disclosure via the Drupal AdvAgg module.
- Leveraged Shodan and the Wayback Machine to uncover PII leaks.

• Bugcrowd

Security Researcher

10/2024 – 04/2025

- Performed security assessments on Bugcrowd programs, testing authentication, session management, CSRF protections, and business logic across web applications.
- Developed custom Python scripts to automate reconnaissance and improve testing efficiency during vulnerability research.

TECHNICAL SKILLS & TOOLS

Focus Areas: Web Application Penetration Testing, API Security Testing, Access Control Testing, Authentication Testing, Business Logic Testing.

Reconnaissance & Enumeration: Subfinder, Assetfinder, Amass, SecurityTrails, Shodan, Google Dorking, Katana, ffuf, Feroxbuster, Gobuster

Security Testing Tools: Burp Suite, OWASP ZAP, Nmap, Nuclei, SQLMap, Wireshark, Postman, Locust

Programming & OS: Python, Linux

EDUCATION

• Hamdard University, Islamabad Campus <i>Bachelor's, Digital Forensics and Cybersecurity</i>	04/2023 – 08/2025
• Hamdard University, Islamabad Campus <i>Associate Degree, Computer Networking</i>	03/2021 – 04/2023

ACADEMIC PROJECTS

Automated Web Security Testing Framework (Final Year Project) | Python, Selenium

- Developed a modular Python framework to automate web application security testing through an interactive, module-based interface.
- Built reconnaissance modules integrating WhatWeb, WAFW00F, and JavaScript file enumeration to collect target technology and attack surface information.
- Implemented an automated credential testing module using Selenium to perform login workflow testing against single-step and multi-step authentication forms.
- Developed an XSS testing module supporting both single-payload and multiple-payload injection against user-specified input parameters, similar to automated payload iteration.

Blockchain Fundamentals Research

- Implemented blockchain concepts including hashing, nonce generation, and proof-of-work.
- Built interactive simulations to demonstrate data integrity and block validation.

IoT Environmental Monitoring System (Final Year Project)

- Developed an Arduino-based environmental monitoring solution using DHT11 sensors and ESP8266.
- Enabled cloud-based monitoring and automated alerts for abnormal environmental conditions.

IoT Smart Fire Prevention System

- Designed a Cisco Packet Tracer simulation featuring RFID access control, smoke detection, and automated sprinkler activation.
- Implemented IoT-based automation for fire prevention and environmental safety.

CERTIFICATIONS & AWARDS

Certificate of Recognition — National CERT Pakistan

Awarded for responsibly identifying and reporting a high-severity security vulnerability.

Letter of Appreciation — National CERT Pakistan

Awarded for dedicated participation and contributions to the National CERT Pakistan CyberNest cybersecurity training initiative.
